ABSTRACTED-PUB-NO: JP07125128A

BASIC-ABSTRACT:

The structure comprises a laminate of a nonwoven fabric layer made of biodegradable thermoplastic synthetic long fibres produced from an aliphatic polyester type polymer obtd. by ring-scission polymerisation and a nonwoven fabric layer made of natural fibres mechanically interlaced together. The structure has dot shape welding areas in which the synthetic long fibres and the natural fibres are welded together. In the areas, the natural fibres (2) present at least in the boundaries between the nonwoven fabric layers are embedded in the molten portions (1) of the synthetic long fibres to be fixed. The nonwoven fabric layers are wholly held together as a unit.

The polymer is poly-epsilon-caprolactone and/or

poly-beta-propiolactone.

USE/ADVANTAGE - The structure is useful for medical and sanitary materials, wiping cloth, packagings and sawdust collecting bags. The structure has biodegradability, high peel resistance and water absorptive, hydrophilic properties.

In an example, as the natural fibres, bleached cotton fibres were used. The nonwoven fabric layers were welded in dot shapes with an ultrasonic wave welder.
